

This document is a retrospective written reconstruction of the standardised verbal instructions used during the formative post-use usability study. It was prepared after data collection to document the experimental procedure and was not distributed as a written handout during the original sessions.

Objective

The objective of the task was to complete an end-to-end data-preparation workflow using the prototype. The task assessed whether participants could understand the interface, inspect system-generated information, review a proposed cleaning plan and export the resulting files.

There was no single correct sequence of transformations. Participants were asked to use their own judgement when accepting or rejecting the system's suggestions.

Task

Participants were asked to complete the following steps:

1. Open the data-preparation prototype.
2. Upload the dataset provided for the session.
3. Inspect the dataset preview and the automatically generated dataset statistics.
4. Review the automatic diagnostics and prognostic warnings shown by the system.
5. Configure the predictive task by selecting the target variable, task type and downstream machine-learning model.
6. Generate an LLM-authored data-preparation plan.
7. Inspect the proposed actions, parameters and explanations.
8. Decide which proposed transformations should be accepted or rejected.
9. Execute the selected transformations.
10. Inspect the resulting dataset and the information shown after execution.
11. Export the cleaned dataset, the original dataset, the cleaning plan and the provenance or audit-log files.
12. Complete the post-use questionnaire and the System Usability Scale immediately after finishing the task.

Researcher Assistance

Participants were expected to complete the workflow independently. The researcher was available only to resolve technical access or interface problems and did not recommend which transformations to accept or reject.

Completion Criterion

The task was considered complete after the participant had executed the selected transformations, exported the resulting files and submitted the post-use questionnaire.

Data and Privacy

Participants were instructed not to upload confidential, personal or sensitive data. The dataset used during the study was supplied for the evaluation task.
